

Jaime C Smith – 05/27/2026 - Table of common Python file methods

Lea sobre el resto de los métodos de la clase File de Python aquí y cree una tabla que explique qué hace cada uno. No necesita usar código para esto, es solo crear una tabla en Notion o Word.

METHOD	DESCRIPTION
read()	Reads and returns the entire content of the file as a single string.
read(size)	Reads up to <code>size</code> characters (or bytes) and returns them as a string.
readline()	Reads one line from the file and returns it, including the newline.
readlines()	Reads all lines and returns a list where each element is one line.
write(string)	Writes the given string to the file; returns the number of characters written.
writelines(seq)	Writes a sequence of strings to the file (no newlines added automatically).
seek(offset)	Changes the current file position to <code>offset</code> bytes from the file start.
seek(offset, whence)	Changes position relative to <code>whence</code> (start, current, or end).
tell()	Returns the current file position (in bytes from the beginning).
close()	Closes the file; no further reading/writing is allowed afterward.
flush()	Forces the write buffer to be written to disk immediately.
truncate(size)	Resizes the file to <code>size</code> bytes; if omitted, truncates at the current position.
isatty()	Returns True if the file is connected to a terminal/console, else False.
readable()	Returns <code>True</code> if the file was opened in a mode that allows reading.
writable()	Returns True if the file was opened in a mode that allows writing.
seekable()	Returns <code>True</code> if the file supports seeking (random access).
